

Boord Owner — what's new

Everything that changed from v1.7.1 to **v1.9.0**, in plain words. Written for the owner; the last section is for whoever looks after the server.

In short. The AI box on the Estimate tab got much more capable (it can check your estimate before you save, explain what changed between versions, and look things up for itself). The Dashboard gets a short daily brief. The Weather tab now has its own AI box that also knows the forecast. Two pack-out changes follow André's answers. Nothing here changes a figure on its own — the AI only reads and explains.

Estimate tab

Check before I save

A button next to **Save**. The AI reads the version on screen, including edits you haven't saved, and gives every block a flag (high, medium, low or fine), a one-sentence reason, and the kg/tree range that block's own history supports. Each block's row gets a small badge; tap it to read the finding. The whole-farm points appear in a card. The app checks every finding against your real blocks first and throws away anything about a block that isn't in the estimate. It never changes a figure.

What changed?

Once a season has two saved versions, a button next to the Version selector compares them. The app works out the differences block by block, and the AI explains what moved and why it matters. You can carry on with follow-up questions.

Ask AI about this estimate

The question box is now called **Ask AI about this estimate**. When the server uses Claude it answers more carefully and can look things up on its own: a block's full season record, a season's weather, how a season's picking ran, and (if Boord Notes is linked) the farm notes. The panel tells you what it is looking up while you wait. Answers that are cut off or declined now say so instead of looking complete, and answers follow the language of your question.

Ask the farm notes

If Boord Notes is installed on the same server and linked, a tick box under the question box sends your question to Notes instead, and lists the notes it used under the answer. The two apps still share no data.

Pack-out, following André's answers

- The pack-out is **one split for the whole farm**, as a share of the picked kg, with **juice as its own line**.

- **kg per carton** on a packed line is measured on packed fruit — picked kg minus the juice kg, divided by the units packed (the 2025 sheet's method, not the Produksie sheet's). The tooltip and the paragraph above the table now say the same thing, and the pack-type hint reads "2 kg".
- The **weather model comes after your own estimate**: until at least one block has a kg/tree, the AI is given no weather-model figures and the "compare with the weather model" suggestion is hidden.

Dashboard

Today's season brief

One short paragraph, written once a day by the AI from the current season's latest estimate: how picking is going against the estimate, how the weather model's Expected kg has moved over the last days, and a block or two worth walking. It is stored on the server, so it appears instantly and still shows offline. **Refresh** writes a new one. With no estimate for the season, nothing is written.

Weather tab

Ask AI about this weather

A new question box under the chart. Tap a suggestion — *How does 2025 compare with the record average?*, *What does the forecast look like this week?*, *Is there frost or heat in the forecast?* — or type your own. The AI answers from:

- the **years and measurements you have ticked** (per year: lowest and highest day, totals for rain and sunshine, month by month);
- every **year on file**, so one year can be ranked against the rest. The current, unfinished year is compared with the same stretch (1 January to today) of other years, not with whole years;
- the **last 7 days, current conditions**, and the **forecast for the next 7 days**, with frost nights (2 °C or lower), hot days (35 °C or higher) and rain days picked out.

It uses only the farm's own location from Boord's settings. The GPS position is used to fetch the forecast but is **not** sent to the AI. With no GPS set there is no forecast; if the forecast service can't be reached, you still get an answer from the history. The forecast is a model's guess, least reliable beyond about three days. Changing the ticks starts a fresh conversation.

Guides

- The owner **training guide** (PDF) is rebuilt with the new sections: pack-out, Check before I save, What changed?, the daily brief, Ask the farm notes, and Ask AI about this weather.
- A new one-page **Estimate tab quick guide** (docs/Estimate_Guide.pdf).

Good to know

- **The AI can be wrong.** It is held to the figures it is sent, and a note appears when it names a season or block that isn't on file — but check anything that matters against the tables.
- **What leaves the farm.** Asking sends the figures on the tab (and your notes, for the Estimate tab) from the farm server to the AI provider. Worker, supplier and lot data are not sent.
- **It only reads.** Answers never change an estimate; you can copy one or add it to the notes yourself.
- **A daily limit** (200 AI calls a day by default) covers every AI feature, and the panel shows the count.

For whoever looks after the server

Item	What to know
Update	Run <code>update_owner_server.bat</code> . It installs only a release signed with the release key (v1.9.0 is). It adds the <code>anthropic</code> Python package; check the server log after the restart.
AI provider	Anthropic Claude is now supported alongside Gemini, Groq and custom. Set <code>OWNER_AI_PROVIDER=anthropic</code> and the key (<code>OWNER_AI_API_KEY</code> , or <code>ANTHROPIC_API_KEY</code> , or a key file). The Check, What changed? and lookup features need Claude to get the best result; the other providers still answer questions from the figures sent.
Shared key	<code>OWNER_AI_KEY_FILE</code> can point at Boord Notes' <code>data/anthropic_key.txt</code> so one key serves both apps.
Daily cap	<code>OWNER_AI_DAILY_LIMIT</code> (default 200). Held in memory; resets at midnight and on restart.
Boord Notes link	<code>OWNER_NOTES_URL</code> (e.g. <code>http://127.0.0.1:8020</code>) and optionally <code>OWNER_NOTES_PUBLIC_URL</code> for links under answers. The installer now asks for both.
Daily brief	A background job checks every <code>OWNER_BRIEF_HOURS</code> (default 6) whether today's brief is written. It uses the AI cap and does nothing without a key or an estimate.
Installer	<code>install.ps1</code> now offers Anthropic as a provider and has a new optional step for the Boord Notes address.
Weather ask	Needs the farm's GPS in Boord's settings for the forecast. Reads the stored history; fetches only the forecast, with Boord's database released first.
Database	owner.db gains a table for the daily briefs. The upgrade is automatic and additive.

Version history

Version	What it brought
1.7.1	Starting point for this summary.
1.8.0	Claude as an AI provider, Check before I save, What changed?, the daily brief, the Boord Notes link, lookups, the daily cap; pack-out and weather-model-order changes from André's answers.
1.9.0	Ask AI about this weather (with the forecast); the Estimate box renamed "Ask AI about this estimate"; code clean-up with no change in behaviour; rebuilt training guide.
