

Estimate tab — Quick Guide

Boord Owner · your crop estimate for the season, block by block

The **Estimate** tab is where you write down your crop estimate for a season: the kg per tree you expect from each block, multiplied by its trees. The app doesn't make the call — it shows each block's history so you can judge against it, keeps every version you save, and once picking starts it shows how the season is tracking against your number.

1. Start an estimate

1. Open the **Estimate** tab and choose the **Season** at the top.
2. If there is none yet, tap **Start an estimate**. Every block in Boord's register appears with its current tree count.

2. Fill in kg per tree

Each block row shows its history in kg per tree: last season, the last-5 average, the best 5 of the last 10, and the range. Type your figure in **Estimate kg/tree**; **Estimate kg** is worked out for you. A block you don't want in the estimate can be left out with the × button.

To start from a past figure, use the fill bar above the table:

Fill kg/tree from	Last season · Last 5 seasons' average · Best 5 of the last 10 · Similar seasons (once loaded)
Change %	Adjust the fill up or down, e.g. 12 for “last season +12%”
For	Blocks without a figure (safe) or All blocks (overwrites what you typed)

Tap **Fill**, then adjust the blocks that look different when you walk the orchard. The farm total updates as you type.

3. Notes, pack-out and saving

- **Notes** — your reasoning, e.g. “late start, block 7 can swing either way”.
- **Pack-out** (optional) — add a line per channel and pack type (e.g. Export sea, 4.5 kg): your share of the picked kg and kg per carton. The app turns that into kg and cartons per channel. Leave kg/carton empty for juice and rejects. These are your figures, not packing records.
- **Save** — a red *Unsaved changes* tag shows until you do.

4. Versions

Tap **New version** to copy the current one and revise it (e.g. the January estimate, then a revision after fruit set). Every version is kept, so you can see how your call moved. Switch between them with the **Version** menu. **Excel** exports the estimate; **Delete** removes a version.

5. Checks against your number

- **Weather model cross-check** — the Risk tab's Harvest Forecast (Favorable / Expected / Unfavorable) beside your total. It is built from weather only, so it can't see tree numbers, fruit set or pests. A gap is a reason to look again in the orchard, not proof either is wrong. Each saved version keeps the model's figures as they were at the time.
- **Similar past seasons** — past seasons whose weather so far came closest to this one, with their crop, picking start and length.
- **Farm total by season** — every season on file, with your estimate as the last bar.
- **This season so far** (once picking starts) — kg picked and % of estimate per block, and a projection of where the season is heading. The projection only appears once enough of a typical season has been picked, and comes with a range.

6. Ask about this estimate

If the farm server has an AI key, a question box appears near the top. Tap **Review this estimate, Which blocks look out of line with their history?, Are we on track?**, or type your own question. It includes unsaved changes, so you can ask before saving. Under an answer you can ask a follow-up, copy it, or **Add to notes** and edit before saving.

The AI never changes the estimate, and it can be wrong — check anything that matters against the table. Asking sends this estimate's figures (block kg, your notes, pack-out mix) to the AI provider; worker, supplier and lot data are not sent.

A season at a glance

1. Before the season: **Start an estimate**, fill from a past figure, adjust block by block, add notes, **Save**.
2. Compare with the weather model and similar seasons; ask the AI for a review if you like.
3. After fruit set or other news: **New version**, revise, **Save**.
4. During picking: watch *This season so far* against your estimate.
